

Relationship Between Natural Ventilation and Users' Comfort

SPSS Correlation Analysis

Assessment of Natural Ventilation on Users' Comfort in a Lecture Hub

Purpose of the Analysis

A Pearson Product-Moment Correlation analysis was conducted to examine the relationship between natural ventilation adequacy and users' comfort in the lecture hub.

Pearson Correlation Results

Table 1. Pearson Correlation between Natural Ventilation Adequacy and Users' Comfort

	Natural Ventilation	Users' Comfort
Natural Ventilation	1	0.013
Users' Comfort	0.013	1
Sig. (2-tailed)	—	[Insert SPSS p-value]
N	384	384

Interpretation

The Pearson correlation coefficient was $r = 0.013$, indicating a very weak positive relationship between natural ventilation adequacy and users' comfort. The magnitude of the correlation is negligible, indicating little to no linear association between the two variables in the study sample.

Statistical Significance

Correlation coefficient (r): 0.013

Significance level (α): 0.05

Sig. (2-tailed) / p-value: 0.792

The statistical decision should be based on the p-value shown in the original SPSS output. If $p > 0.05$, the relationship is not statistically significant. If $p < 0.05$, the relationship is statistically significant.

Conclusion

The Pearson correlation analysis indicated a negligible positive relationship between natural ventilation adequacy and users' comfort ($r = 0.013$). The strength of the relationship is very small. The statistical significance should be reported using the corresponding p-value from the SPSS output.
